Allbirds / supplied catalogue snapshot

What your catalogue lets us verify, and what to publish next.

Single-merchant demonstration drawn from the local Shopify export. Includes only the supplied products and variants; completeness against the live store is unmeasured. Product categories require separate review.

Proposal for review. No schema has been adopted. A merchant reviewer must confirm the category, source mappings and required attributes before verification uses it.

Below the proposed minimum: size

2 / 2,857 listings (0.0700%; Wilson 95% interval 0.0192%-0.25%)

Conditional on this suggested minimum; this is not a complete purchase check.

No structured comparison evidence

0 / 2,857 listings (0.0%; Wilson 95% interval 0.00%-0.13%)

No exact merchant-attributed, non-advice attribute usable as a comparison anchor.

Audit denominator: 2,857 / 2,857 expanded listings from 294 / 294 supplied product records.

Missing or unusable product evidence prevents verification of a request that depends on that attribute. The affected traffic share is unmeasured: listing frequency is not request frequency.

Category / cohort: allbirds.supplied
Audit date: 2026-09-13T00:00:00Z
Model: none-deterministic; prompt: none
Intervals: Wilson 95%, descriptive catalogue counts, not accuracy.

Publication by attribute

Usable publication is a consistent typed reading from a structured source or labelled prose. Missing means no nonempty source. Present but unusable means a value exists but cannot support a consistent typed reading.

Every cell reports listings / all expanded listings, followed by its rate and Wilson 95% interval. This is the supplied snapshot, not an estimate of the live store.

Attribute / dimension	Usable publication	Missing	Present but unusable
alt unresolved	0 / 2,857 (0.0%; 95% interval 0.00%-0.13%)	2,857 / 2,857 (100.0%; 95% interval 99.87%-100.00%)	0 / 2,857 (0.0%; 95% interval 0.00%-0.13%)

vendor nominal	2,857 / 2,857 (100.0%; 95% interval 99.87%-100.00%)	0 / 2,857 (0.0%; 95% interval 0.00%-0.13%)	0 / 2,857 (0.0%; 95% interval 0.00%-0.13%)
width count	19 / 2,857 (0.7%; 95% interval 0.43%-1.04%)	2,838 / 2,857 (99.3%; 95% interval 98.96%-99.57%)	0 / 2,857 (0.0%; 95% interval 0.00%-0.13%)

Minimum-eligible evidence additionally requires exact merchant attribution and excludes advice. The companion HTML and JSON include those counts and parsed-only counts for every attribute.

What to publish next

Start with facts customers request and the minimum your reviewer selects. The counts below describe catalogue gaps; they do not promise increases in covered traffic.

size

Cannot verify this attribute on 2 / 2,857 listings (0.0700%; Wilson 95% interval 0.0192%-0.25%)

Publish this fact for each affected sellable SKU, including explicit variant selections where applicable.

Conditional scenario: If every gap for this attribute becomes consistent, exact merchant evidence; other attributes remain unchanged. Additional listings meeting the proposed minimum: 2 / 2,857 listings (0.0700%; Wilson 95% interval 0.0192%-0.25%). Remaining below it: 0 / 2,857 listings (0.0%; Wilson 95% interval 0.00%-0.13%). This is not an observed improvement.

price

Cannot verify this attribute on 2,857 / 2,857 listings (100.0%; Wilson 95% interval 99.87%-100.00%)

Publish an explicit ISO currency with each amount, or establish a trusted catalogue currency during onboarding.

compare_at_price

Cannot verify this attribute on 2,857 / 2,857 listings (100.0%; Wilson 95% interval 99.87%-100.00%)

Publish this fact for each affected sellable SKU, including explicit variant selections where applicable.

Publish an explicit ISO currency with each amount, or establish a trusted catalogue currency during onboarding.

Other fields in the publication table may be incidental catalogue metadata. Review their relevance before asking the merchant to publish more data. The HTML and JSON preserve every field's diagnostics and conditional remediation, including source mapping ambiguities.

Method and provenance

Suggested minimum: size. Most-published observed selection axis; otherwise most-published structured product attribute. Suggestion only; reviewer must select the floor.

Review separate category cohorts before treating this minimum as necessary or sufficient. When no minimum is found, every supplied listing remains below it; an empty catalogue has no rate.

Counts are exact for the supplied snapshot. Wilson intervals follow the existing catalogue coverage report; they do not establish confidence about unsupplied products, future traffic or accuracy.

Parent facts are inherited into variants. Empty or ambiguous variant collections remain unresolved denominator rows. Duplicate rows remain counted. Structured merchant attribution is an onboarding assumption requiring review, not a contractual liability finding.

Methodology: DR 0015 catalogue coverage report and DR 0007 verification floor. Counts reuse the schema proposal and Wilson implementation in harness/coverage.py. No model, receipt or authorisation is produced.

Review notes:
attribute_diagnostics_require_review
human_review_required: catalogue frequency cannot establish the category's necessary attributes

The companion HTML contains the full source locators, minimum-eligible shares and per-attribute diagnostics; JSON also preserves the machine-readable report and schema proposal.
